

Chorus Search

Search any data, anywhere

Chorus Search is a data virtualisation platform that connects to any internal or external intelligence source, to search for and enrich data being interrogated.

Connect to and query data to uncover links and hidden patterns between people, objects, locations and events. Visualise the data in IBM i2® Analyst's Notebook or one of the Chorus applications.

Visualise and enrich data

With a single log on, automated and end-user driven data searches can be performed across multiple sources. Find relevant data, consolidate it and visualise it in IBM i2® or Chorus to help build a case and answer key investigation questions.

A streamlined, time saving approach

Search links directly to different data sources and merges the information in one master data model. Access and interpret the information quickly for fast time to insight and to free up valuable resource.

Pre-configured links to gather intelligence

Search can access the most widely used providers of intelligence data. This includes consented data, social media, news feeds, company information and threat intelligence.

Connect the dots, see the bigger picture

Be confident that you can access all data required by creating bespoke connectors for any databases or intelligence systems where access is permitted. Pull data from, and import relevant historic data into, the new investigation.

Licensing

In most cases Chorus Search can leverage existing licences in place with intelligence providers. If organisations wish to connect to a new data source, Chorus can act as an intermediary to licence the data and then provide the connection into analysis products.
